

Capstone 3: Peer Review Questions

Please create a **new post** in Teams **for each peer review** that you complete. You should make 4 posts total, one for each peer review.

At the top of the post, @tag the person whose work you are reviewing.

Then **copy and paste** the below headers into the post:

1. In-Class Presentation
2. Video Presentation
3. Report Visualizations
4. GitHub Repository
5. Overall

For each header, include **at least two comments** using the below format. (You can pick from the list below, or you can write your own feedback comments in a similar style.) Each comment should reference a specific part of the work (a piece of code, visualization, explanation, or recommendation) and explain why it was effective or what could improve.

Feedback should be a mix of what went well and what suggestions you have for improvement. Across your comments, include at least one constructive suggestion that could strengthen the project.

Affirming understanding / insight

I really liked where you...

I hadn't thought about the data that way before, but your analysis of... helped me see...

The way you explained... made it easier to understand why...

Your recommendation made sense to me because...

Noting effective technique

It was useful to see the information you found on... because it helped me understand...

I thought it was a smart choice to... because...

The way you organized your... made it easy to follow along because...

Your chart effectively showed... because...

Clarifying questions

I was confused about the part where...

I wasn't sure how you got from... to your conclusion that...

It would have helped me to see... before you moved on to...

I lost track at the point where...

Constructive suggestions

I would have liked to see more about...

One thing that might strengthen this is...

I think that... would have made the recommendation clearer.

It might be easier to follow if... came before... in the presentation.

Connecting to your own work

Seeing how you handled... gave me an idea for how I might approach... in my own project.

I'm going to try... in my own work after seeing how well it worked here.

Write at least two thoughtful comments for each heading from page 1 (minimum of 10 comments total), then post your feedback to Teams.

When you have completed your own peer review posts, be sure to check out the reviews you received. No reply is required, but consider replying to highlight any comments you find particularly helpful or valuable. You can also post clarification or reply with additional information where asked. (However, do not post argumentative replies. It is an important professional skill to graciously accept feedback *even when you disagree with it*. If you only listen to feedback that you agree with, that's a recipe for disaster!)
